Our History

THE EARLY YEARS

GLOBAL GROWTH & GENOMES

THE TRANSFORMATIVE YEARS

THE NEXT GENERATION

2020

Ancestry reaches over 3.5 million subscribers and 27 billion records.

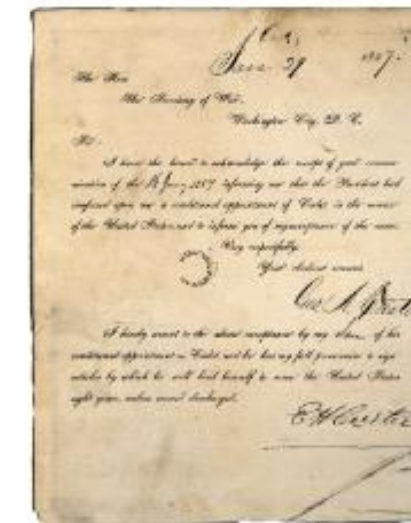

2021

AncestryDNA reaches a new milestone with over 20 million people in its DNA network.

2021

Ancestry hits over 30 billion records in its online database.

2022

AncestryDNA expands to new global markets in North America, South America, Europe, Asia and Africa making AncestryDNA available in more than 80 markets on five continents.

Late-Onset Alzheimer's Disease

Alzheimer's disease is characterized by memory loss, cognitive decline, and personality changes. Late-onset Alzheimer's disease is the most common form of Alzheimer's disease, developing after age 65. Many factors, including genetics, can influence a person's chances of developing the condition. This test includes the most common genetic variant associated with late-onset Alzheimer's disease.

Jamie, you **do not have** the $\epsilon 4$ variant we tested.

Your risk for Alzheimer's disease also depends on other factors, including lifestyle, environment, and genetic variants not covered by this test.

What is Predictive Testing?

This section is intended to help the individual considering testing for HD reflect on some of the issues involved in testing and in dealing with the test results.

Family, friends and professional support people may also find this material useful in supporting those considering testing.

In 1983, genetic markers closely linked to the Huntington disease (HD) gene were identified. This discovery, together with the identification of additional genetic markers, led to the development of predictive testing

HD Resources

There are many other online websites and resources which provide information regarding HD in general, support

groups in your area, research updates and opportunities to be involved in clinical trials.

[Find out more](#) ▶

Our Stories

We understand that learning that someone in your family has HD can be devastating. It can leave you with

questions, concerns, and no idea where to turn next. Find about more about what others have done in your situation – you are not alone.

TruGenome Predisposition Screen Clinical Report

No pathogenic or likely pathogenic variants were found in the 1,691 genes evaluated that are expected to be clinically significant for the patient. However, this screen only detects single nucleotide substitutions and insertions and deletions of up to seven base pairs. Other types of genetic variants, including but not limited to larger insertions or deletions, copy number variants and trinucleotide repeats are not reported in this screening test. Further, the coverage of each gene is less than 100%. Therefore, clinically significant variants could exist in this genome that are not detected with this test. The coverage for each gene is provided in the Gene-Disease appendix.

Here is what we see in your DNA...

Your odds of developing male pattern baldness are increased if you are Caucasian.

You are less likely to have flush reaction if you drink alcohol.

Your muscle fibers are built for power.

You are likely to perceive bitter tastes.

MATTER

Scientists Finish the Human Genome at Last

The complete genome uncovered more than 100 new genes that are probably functional, and many new variants that may be linked to diseases.

A century ago, scientists knew that genes were spread across 23 pairs of chromosomes. But pinpointing any single gene and deciphering its sequence was a struggle that could have consumed a career. Michael Abbey/Science Source

By Carl Zimmer

Published July 23, 2021 Updated July 26, 2021

Two decades after the draft sequence of the human genome was [unveiled](#) to great fanfare, a team of 99 scientists has finally deciphered the entire thing. They have filled in vast gaps and corrected a long list of errors in previous versions, giving us a new view of our DNA.

Telomere-to-telomere consortium

We have sequenced the CHM13hTERT human cell line with a number of technologies. Human genomic DNA was extracted from the cultured cell line. As the DNA is native, modified bases will be preserved. The data includes 30x [PacBio HiFi](#), 120x coverage of [Oxford Nanopore](#), 70x [PacBio CLR](#), 50x [10X Genomics](#), as well as [BioNano DLS](#) and [Arima Genomics HiC](#). Most raw data is available from this site, with the exception of the PacBio data which was generated by the University of Washington/PacBio and is available from [NCBI SRA](#).

UCSC browsers are available for [v1.0](#) and [v1.1](#). An interactive dotplot visualization of all genomic repeats is also available from [resgen.io](#). Known issues identified in the assembly are tracked at [CHM13 issues](#).
